WHO WE ARE

THE COMPANY

In Riccione, at the centre of the Adriatic Sea coastline, where the sea tradition has its strongest roots, TECNO IMPIANTI has its own head office. This company is a leader in the planning, manufacturing, marketing and installing of aquaria fish-farms and industrial plants for the maintaining of crustaceans, fish and edible molluscs with lamella gills. In the real estate shed, placed in 32, Montefeltro Road, the manufacturing of these plants is based on the complete blend between the technological and the most advanced engineering solution, and the care and precision of the handicraft manufacture. All these elements contribute to transform every single plant in a highly finished product. Almost a "hall-mark" that allowed TECNO IMPIANTI to spread out on the whole national territory and to obtain, among its customers, very important chains of big department stores and wholesalers of large share fish products.

THE PRODUCTION

Starting from the assumption that the needs of our Customers are at the core of our activities, all our Company strategies are oriented in this direction. So much so, that in the last more than ten years, since its birth, TECNO IMPIANTI has been building an absolutely prestigious role on the Italian market, both for the reliability of its products and their ongoing technological improvements. A proof of the validity of this Company's winning strategy has precisely come out of the main national and international fair exhibitions the company has always taken part to. The same happened with the opinions of the sector's press that was several times interested in Tecno Impianti. So, it should be rightly asserted that the Company, with its wide range of plants, is able to give well-founded, highly efficient answers to the needs of the fish market and, particularly, to the marketing of fish products and live edible molluscs.

THE RESEARCH

The first handicraft steps taken in the "home courtyard" saw the building of the first aquaria fish-farms, aimed at restaurants and fishmonger's, with the use of insulated glass structures, stainless glass and wood. Since then, many steps forward have been made with the production of the first aquaria bodies with polyvinyl material and, particularly, with PVC and VTR (fiberglass reinforced plastic). A route that gradually improved the professional skills of the staff in the task of choosing the most suitable materials to be used, in the selection of the dies and the search for the best bands for the body production, in the planning and manufacturing of the prototypes. The excellent reply of the market, thanks to the refined design of our products, but, first and foremost, thanks to the thoroughness and efficiency of the plants, convinced the Company itself to have found the way to success, constantly stimulating the willingness to obtain an ongoing improvement, both on the project side and in the search for the best technological solutions. Throughout this ongoing growth, TECNO IMPIANTI has never abandoned its handicraft-accuracy and thought of turning to prestigious Research Institutes in order to test its plants, as a guarantee of absolute reliability for the Customer. In cooperation with Professor Angelo Savino, Hygiene Department of the University of Perugia (Italy), an experimentation project "on the ground" has been conducted. This testing certified that Tecno impianti's plants are the best option you can find for the bacterial sterilisation of culture water and for the complete functionality of the system. The cooperation with Academic Research has become part of our comprehensive company strategy.

THE NEW COMPANY STRATEGY

The aim of the Company is that of integrating the production sector and the marketing and Customer assistance phases at best. The production sector has been widely described in its operational strategies, whereas the Customer assistance service, though thoroughly satisfactory, can be further improved in order to raise the Customers' trust in TECNO IMPIANTI's plants and aquaria fish-farms. In the next few months our personnel will be improved and increased, both in the production and in the marketing sectors. This is aimed at making the Customer feel more "comfortable", so as to have always the chance to get immediately in touch with the Company. All these initiatives have been taken both to facilitate the purchase of new products and in view of the resolution of problems. These empowering measures have already been estimated within the Company budget and will be immediately carried out.
